RE: Drifting Exposure

Enclosed are the results of analyses for samples received by the laboratory on 08-Jan-2016. The samples associated with this report will be held for 90 days from the date of this report. The raw data associated with this report will be held for 5 years from the date of this report. If you need us to hold onto the samples or the data longer than these specified times, you will need to notify us in writing at least 30 days before the expiration dates. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Dale Rosado, Ph. D.

Project: Drifting Exposure

Project Manager: Bart Chadwick

Reported:
29-Mar-2016

Case Narrative

No issues were experienced during the analysis of Work Order 6010804 unless specified below.

OC Pesticides - Degradation of dBHC in the LCS standard resulted in low recoveries in the BS, MS, and MSD. However, the calibration for dBHC was acceptable with good responses and it would have been detected if it had been present in the samples.

The extra bottles that were sent for QC were inadvertently checked in as individual samples. The samples were ran at no additional charge. These can be use a field collection dups if needed.

Reported:
29-Mar-2016

Notes and Definitions

- U Analyte included in the analysis, but not detected
- S-GC Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate/s.
- QM-07 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
- Q Value is outside of acceptance limits.
- J Detected but below the Reporting Limit; therefore, result is an estimated concentration.
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference

Appendix B4: DGT Chemistry

ORANGE CELLS ARE FOR INPUTTING PARAMETERS

Step 1: Enter the deployment and recovery date and time - this will auto-calculate the exposure period in seconds. (t)

Step 2: Enter the average temperature during the deployment in whole #'s - this will determine the Diffusion Coefficient for each metal.

Step 3: Enter the Volume of HNO3 added to resin gel during acidification step. (VHNO3)

Step 4: Enter the Sample IDs and Concentration of metal as measured by ICP-MS in the nitric acid elution. (Ce)

Step 5. Enter the thickness of the diffusive gel layer. (Δg)

Step 6. Enter the exposure area as found on the container in which DGTs are delivered in. (A)

The Green Highlighted cells are the final DGT concentration for each metal in $\mu\text{g/L}$ (there is a 1000x multiplier to convert from $\mu\text{g/ml}$ to $\mu\text{g/L}$).

Appendix B5: SPME Chemistry

Drifter - Short Term Passive Sampler

Introduction

Measurement of available concentrations of hydrophobic organic contaminants in surface water is important to understanding fate, transport, and potential risk of contaminants. *In situ* passive sampling has been used to obtain freely-dissolved concentrations in surface water as a time-integrated measurement capturing the change in concentrations during the exposure period of the GPS drifter deployment. Passive samplers have not been used with GPS drifters previously to our knowledge since the duration of exposure would not be sufficient to reach a fraction to steady state that could be used to calculate freely dissolved analyte concentrations. Time to reach equilibrium in polydimethylsiloxane (PDMS) for freely dissolved hydrophobic organic contaminants in the water column can be weeks to months utilizing performance reference compounds (PRCs) to evaluate the kinetics of the mass transfer and correction for nonequilibrium conditions. Time to equilibrium is known to be dependent on several factors, including flow rate of water over the PDMS coating of the solid phase microextraction (SPME) fiber. Flow rate has been acknowledged as a parameter to manipulate for optimization of deployment time, with higher water flow rates resulting in shorter time to equilibrium (Booji et al. 2016, O'Brien et al. 2012, Vrana et al. 2006).

For use with the storm water GPS drifter ("Dr. Ex"), the study utilized thin (10 micron [μm]) polydimethylsiloxane (PDMS) coated SPME fibers to take advantage of faster kinetics. Furthermore, the surface water surrounding the SPME fibers was agitated by flowing the water with a pump. Agitation aimed to reduce the thickness of the aqueous boundary layer surrounding the sampler to enhance uptake of the analytes into the PDMS. Thereby, reducing the time of deployment needed to reach sufficient time from weeks to month to hour to days in achieving an acceptable fraction to equilibrium.

Objectives

- To reduce the exposure duration of passive samplers to 1 to 2 days to obtain freely dissolved concentrations in surface water to enable time integrated sample over deployment period of stormwater GPS drifters.

Preliminary Laboratory Testing

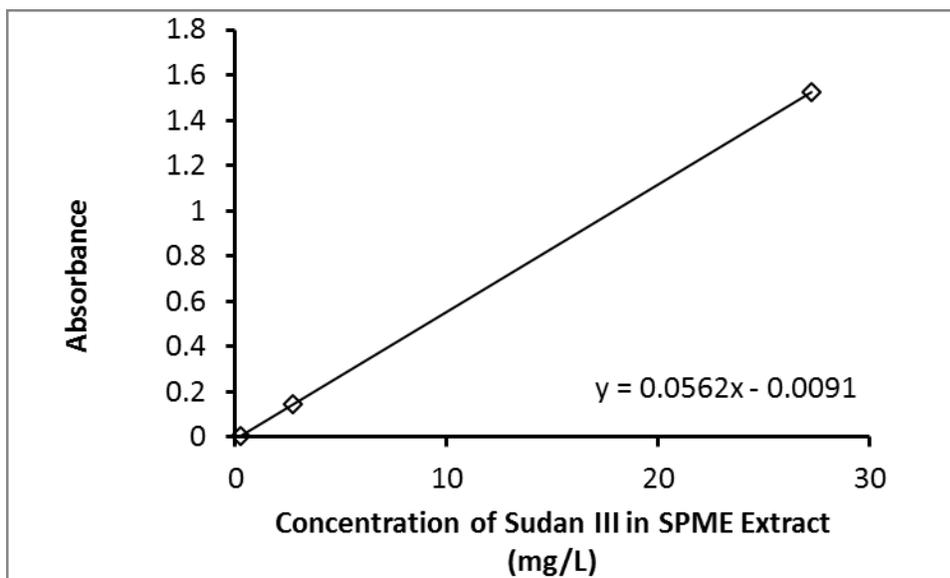

Methods and Results

Prior to deployment in the field, preliminary laboratory testing was performed to confirm an expedited time to equilibrium was observed. These included the use of both a surrogate PRC (Sudan III dye) to reduce analytical costs as well as polychlorinated biphenyl (PCB) PRCs to confirm surrogate PRC results.

Sudan III (Sigma Aldrich, CAS 85-86-9) was selected as a surrogate PRC due to its lipophilic properties (Log octanol-water partition coefficient [K_{ow}] 6 – 7). Sudan III is a fat soluble dye primarily intended for use by the manufacturer as an animal tissue stain. A dilution series of surrogate PRC hexane solutions were created and the absorbance of these solutions was observed at a wavelength of 507 nanometers (nm) to create a preliminary standard curve in November 2014. This preliminary test confirmed absorbance of Sudan III in hexane solution could be observed over a range of concentrations and the relationship between absorbance and concentration from the standard curve could be used to estimate the concentration of Sudan III in a hexane extract.

In December 2014, surrogate PRC 80:20 methanol:water solution was created (273 milligrams per liter (mg/L) and varying lengths of SPME fiber (10µm PDMS coating thickness, Fiberguide Industries, Stirling, NJ, "SPC210/230R, No Jacket, CL-0097-1") were loaded with surrogate PRCs under agitation and static conditions for varying durations. The SPME fibers were then wiped with a Kimwipe, cut, placed in an amber glass autovial, and extracted with 1.8 milliliters (mL) of hexane. The extraction was transferred to cuvetts and absorbance was observed on the spectrometer at 507 nm. Uptake of surrogate PRC was found to be preferable under agitation conditions for a duration of greater than 24 hours and not housed within a steel mesh envelope.

| Test | Length of SPME Fiber (cm) | PRC Uptake Conditions | PRC Uptake Duration | Absorbance | Concentration of Sudan III in PDMS (ng/µL) |
|----------|---------------------------|-------------------------------------|---------------------|------------|--|
| Fiber #1 | 100 | Stir | 3 hours | 0.063 | 240 |
| Fiber #2 | 12 | Stir | 3 hours | 0.006 | 250 |
| Fiber #3 | 150 | Stir, housed in steel mesh envelope | 3 hours | 0.031 | 132 |
| Fiber #4 | 150 | Static | 26 days | 0.533 | 1669 |

In the second week of February 2015, elimination of Sudan III from SPME fiber was observed at various time points. Surrogate PRCs were loaded to 200 centimeter (cm) lengths of SPME fiber coiled, placed in 273 mg/L surrogate PRC methanol:water solution, and rotated for 4 hours. The fiber was wiped with a Kimwipe and placed in teflon tubing attached to pumps. Pumps were placed in a flow-through tank (6171 L/day) with intake from San Diego Bay. Two flow rates were used with same pump by selecting tubing with two different diameters (1/4- and 3/8-inch). Static tests were also conducted in beakers in the same walk-in cooler as the flow-through tank with San Diego Bay water. In the 24 hour time point,

elimination of the surrogate PRC from PDMS of the SPME fiber was observed from the blanks and the lower and higher flow rates had similar eliminate rates; both eliminated more quickly than static conditions. However, at the 48 hour time point, elimination was not observation as expected, potentially due to interference from absorbance of undesired materials into PDMS from San Diego Bay water. It was also noted that the flow through system did not flow for approximately 8 hours in the evenings. An absorbance of 0.008 was observed for hexane extraction of unexposed, blank fiber.

| Test | Elimination Conditions | Absorbance | Concentration of Sudan III in PDMS (ng/μL) | Percent to Equilibrium (%) | Elimination Rate (1/day) |
|---------------------|---|-------------------|---|-----------------------------------|---------------------------------|
| Blank #1 | NA | 0.074 | 260 | NA | NA |
| Blank #2 | NA | 0.095 | 220 | NA | NA |
| Lower Rate t=24 | Pumped 24 hours Flow rate 1592 L/day | 0.006 | 36 | 85 | 1.91 |
| Higher Rate t=24 | Pumped 24 hours Flow rate 2750 L/day | 0.006 | 33 | 86 | 1.97 |
| Static t=24 | Static 800 mL beaker 24 hours | 0.030 | 97 | 60 | 0.91 |
| Lower Rate t=48 | Pumped 48 hours Flow rate 1592 L/day | 0.004 | 31 | 87 | 1.03 |
| Higher Rate t=48 | Pumped 48 hours Flow rate 2750 L/day | 0.003 | 35 | 85 | 0.96 |
| Static t=48 | Static 500 mL beaker | 0.045 | 128 | 47 | 0.31 |

In the fourth week of February 2015, simultaneous surrogate and PCB PRC elimination tests were performed. One set of fibers was loaded with Sudan III (93 mg/L surrogate PRC methanol:water solution) and another with PCB PRCs (0.2 μg/mL of each rare PCB congener PRC (80:20 methanol:MQ water solution containing PCB-29 (Trichlorinated homolog PRC), PCB-69 (Tetrachlorinated homolog PRC), PCB-104 (Pentachlorinated homolog PRC), and PCB-154 (Hexachlorinated homolog PRC)) by rotating coils for 24 hours. The fibers were wiped with Kimwipe and placed in Teflon tubing attached to pump (flow-rate 2750 L/day). Pump assemblies were placed in the flow-through tank with San Diego Bay water and it was confirmed the system was operational the entire duration of the experiment. Static conditions were also observed by placing wiped, loaded fibers in the Teflon tubing placed into the flow-through tank (one surrogate PRC and one PCB PRC). Two pump assemblies housed fibers with surrogate PRCs and two with PCB PRCs. After the time points were reached, fibers were wiped with Kimwipe, cut, placed in amber glass autovial, and extracted with 1.8 mL of hexane. Sudan III was extracted for 10 – 15 minutes. PCB extractions were maintained cool (4 degrees Celsius) until analysis by ERDC. Utensils such as forceps and scissors were decontaminated between samples. Prior to absorbance measurements, each cuvette was filled with hexane blank and an absorbance reading of 0.000 ± 0.006 was observed to ensure adequate cleaning between samples (cuvettes were air dried prior to measurements).

The surrogate PRC was observed to be eliminated in the 1 and 3 hour pumped time points at a similar rate to the static 3 hour time point. The 5 hour pump time was found to be closer to equilibrium than the static 5 hour time point; however, the elimination was not found to be closer to equilibrium than the

1 and 3 hour time points, likely due to absorbance of an undesired, unknown dissolved material from San Diego water. Additionally, the elimination rate for the 5 hour time point was not found to be similar to observations of PCB PRC elimination.

Log K_{ow} was referenced from Hawker and Connell (1988)

Elimination of PCB-29 from PDMS was found to be increased by pumping water over the SPME fiber after 5 hours and achieved 90% of equilibrium within 24 hours. For comparison purposes, elimination rate for this testing are compared to the elimination of these PCB PRCs under *in situ* conditions at the Bremerton, Washington ESTCP Project site in the baseline monitoring (PCB PRCs loading and fiber are the same) and the elimination rate was observed to be greater for both time points compared to observations from the Bremerton project after two weeks *in situ* exposure. Similar observations were made for PCB-69, but to a lesser degree. For PCB-104 and PCB-154, the elimination at the 5 hour time point is accelerated compared to the elimination observed in the Bremerton Project. However, in the 24-hour time point, the concentration in PDMS is similar to observations at the 5 hour time point, indicating pumping water over the SPME fibers does not have an observable effect on the elimination of these more chlorinated congeners. The influence of water velocity has been found to decrease with increasing the octanol–water partition coefficient in another PCB passive sampling study utilizing silicone rubber (Estoppey et al. 2014).

In September 2015, battery operated pumps were used to flow water over the PDMS coating of the SPME fibers in a pier-side demonstration prior to field deployment. To save on analytical costs, surrogate PRCs were used for this demonstration. SPME fibers (210 cm) were coiled, placed in PRC solution, and rotated on rollers from August 17 to September 22-23, 2015 to load surrogate PRCs into PDMS. The fibers were removed from PRC solution, wiped with Kimwipe 10 times, placed in 3/8-inch Teflon tubing attached to battery operated pump. Pumps were placed in San Diego Bay from the pier at SPAWAR SSC Point Loma and pumps were turned on with a flow rate of 1440 L per day. All cuvettes were triple rinsed and hexane blank was measured to 0.000 ±0.001 absorbance. Again, the observation was made that the elimination rate was accelerated in the first time points (1-, 3-, and 5-hour); however, in the 24-hour, there appears to be interference with the surrogate PRC from absorbance of undesired, unknown material. Therefore, it was determined the surrogate PRC would not be used under this project under field conditions. Further study of surrogate PRCs is needed to understand these observations and successfully apply surrogate PRCs instead of PAH or PCB PRCs analyzed by an analytical laboratory.

| Test | Absorbance | Concentration of Sudan III in PDMS (ng/μL) | Percent to Equilibrium (%) | Elimination Rate (1/day) |
|-------------|-------------------|---|-----------------------------------|---------------------------------|
| Blank | 0.143 | 329 | NA | NA |
| t=1 hour | 0.099 | 251 | 24 | 6.5 |
| t=3 hours | 0.067 | 165 | 50 | 5.5 |
| t=5 hours | 0.037 | 100 | 70 | 5.7 |
| t=24 hours | 0.061 | 155 | 53 | 0.76 |

Overall, the preliminary laboratory results using a dye surrogate and PCB PRC found the pumping system enhanced time to equilibrium sufficiently to obtain measurements with a deployment duration of one to two days. Therefore, short term passive sampling was performed in the field.

Field Deployment

Methods

The samplers were prepared at the SSC-PAC environmental laboratory in San Diego, California to consist of 14 μL of PDMS (210 cm of 10 μm PDMS coating thickness, Fiberguide Industries, Stirling, NJ (“SPC210/230R, No Jacket, CL-0097-1”). Fibers were preloaded with 2 $\mu\text{g}/\text{mL}$ of each rare PCB congener PRC (80:20 methanol:MQ water solution containing PCB-29 [Trichlorinated homolog PRC], PCB-69 [Tetrachlorinated homolog PRC], PCB-104 [Pentachlorinated homolog PRC], and PCB-154 [Hexachlorinated homolog PRC] and 2 $\mu\text{g}/\text{mL}$ of each deuterated polycyclic aromatic hydrocarbons (PAHs; acenaphthylene-d8, pyrene-d10, and benzo[a]pyrene-d12). Fibers were coiled, placed in PRC solution and rotated for 24 hours. Upon removal from PRC solution, the fibers were wiped with a Kimwipe and placed inside 3/8-inch diameter 12-inch length of Teflon tubing and kept cool (4°C) prior to deployment. The Teflon tubing housing the fibers was attached with a fitting to the battery-operated pump immediately prior to deployment (within 15 minutes). The battery-operated submersible pump was attached to the center of the GPS drifter. The flow rate of the pumps was 1440 L/day. A Standard Operating Procedure for the field is provided in Attachment 1. In addition to field exposed samples, trip blanks were taken into the field, but not exposed to surface water. The fridge blanks were maintained in the fridge of the environmental laboratory in which the samplers were created.

Event 1 Results

All passive samplers were recovered from the GPS drifters. The fibers were retrieved intact with essentially no loss of PDMS volume (Table PCB-E1-1). Samplers were processed and extracted at the SSC-PAC environmental laboratory in San Diego, California. A nominal volume of 1.6 mL of hexane was added to the amber glass vial for extraction and the volumes as calculated by weight are provided in Table PCB-E1-1. When the vials were received at the analytical laboratory, ERDC, it was found that the use of pre-split caps on the vials had resulted in either evaporation or leakage of the hexane extract. Loss of hexane volume ranged from 43% to 96%. None of the samples arrived with fibers fully submerged. This causes uncertainty with the passive sampling results of Event 1. Therefore, freely dissolved concentrations were calculated for demonstration purposes only.

PCB Analysis

Table PCB-E1-2 provides the PDMS-water partition coefficients and solubility for each PCB congener (Smedes et al. 2009). PCB PRCs (PCB-29, 69, 104, and 154) were detected in each sample (Table PCB-E1-3). Non-PRC PCB congeners detected were generally also detected in the fridge and trip blanks at similar masses (PCB-132/153, PCB-146, PCB-147/149, PCB-180, PCB-183, and PCB-187). Therefore, it is suspected these congeners are present in the PRC solution as impurities. Results for the PRC solution submitted for analysis after receipt of passive sampling results are pending.

The concentration of PCBs in PDMS is calculated in Table PCB-E1-4. Table PCB-E1-5 summarizes the concentration of the PCB PRCs in PDMS. There was variability among the concentration of PCB PRCs in PDMS of the blanks. Unexpectedly, lower concentrations in the fridge blanks were observed compared to the trip blanks and in general, lower concentrations in the blanks than the field exposed samples. These unexpected results were potentially due to the use of pre-split caps, which resulted in either leaking or evaporation of the hexane extract and none of the fibers arriving to the analytical laboratory

fully submerged. This causes uncertainty with these results. Therefore, freely dissolved concentrations in water have been calculated for demonstration purposes only.

The concentrations in the composite water samples were below the detection limit of 0.33 ng/L for all PCB congeners. The freely dissolved concentrations of total PCBs in water as measured by passive sampling are below this detection limit, except for sample D109 (total PCB concentration of 0.49 ng/L).

PAH and Pesticide Analysis

The partition coefficients and solubility of PAHs and pesticides are shown in Table PP-E1-1 (Smedes et al. 2009, US EPA 2012, Mayer et al. 2000, Achten and Andersson 2015, and ATSDR). Masses of the PAHs and pesticides in hexane extract are provided in Table pp-E1-2. PAH PRCs (acenaphthylene-d8, benzo(a)pyrene-d12, pyrene-d10) were detected in all samples and blanks, except acenaphthylene-d8 was not detected in sample D106 (masses for several samples were below the reporting limit for acenaphthylene-d8 and pyrene-d10). Fluoranthene and dieldrin were above the detection or reporting limit in one or more samples. Chrysene, phenanthrene, and pyrene results were above the detection limit and below the reporting limit in one or more samples. Concentrations in PDMS were calculated in Table PP-E1-3 and PAH PRCs are summarized in Table PP-E1-4. The concentrations of deuterated PAHs in the blanks were largely variable (CV 75% to 136%). The blank with the least loss of the hexane volume was used to calculate freely dissolved concentrations in water for demonstration purposes only. Overall, the regression models for each sample had strong correlation ($r^2 > 0.8$), with the exception of sample D107 which had pyrene-d10 concentrations in PDMS that were greater than the blanks; correction factors were calculated for this sample, excluding this PRC (Table PP-E1-5). Concentrations in water were calculated in Table PP-E1-6. Fluoranthene was detected in six samples with concentrations ranging from 1.4 to 7.0 ng/L. Phenanthrene was detected in six samples with concentrations ranging from 5.3 to 13 ng/L. Pyrene was detected in six samples with concentrations ranging from 1.3 to 5 ng/L. Dieldrin was detected in seven samples with concentrations ranging from 0.17 to 0.59 ng/L.

In composite drifter water sample for sample D107, benzo (a) anthracene was detected at 17.2 ng/L and fluorene was detected in several water samples (D108, D110, D111, D112, and D114) at concentrations ranging from 18.8 to 44.8 ng/L. Neither of these analytes were detected in the passive sampling results and analytes which were detected via passive sampling were generally at lower concentrations. Detection limits for pesticides and PAHs via composite water sample collection were 0.3 ng/L and 6.6 ng/L, generally similar to passive sampling detection limits.

Event 2 Results

All samplers were recovered with nearly 100% fiber recovery in all samples (Table PCB-E2-1). Hexane extracts were received in good condition by the analytical laboratory.

PCB Analysis

Table PCB-E2-2 provides the PDMS-water partition coefficients and solubility for each PCB congener (Smedes et al. 2009). PCB PRCs (PCB-29, 69, 104, and 154) were detected in each sample (Table PCB-E2-3). Non-PRC PCB congeners detected were generally also detected in the fridge and trip blanks at similar masses (PCB-132/153, PCB-146, PCB-147/149, PCB-180, PCB-183, and PCB-187). Therefore, it is suspected these congeners are present in the PRC solution as impurities. Results for the PRC solution submitted for analysis after receipt of passive sampling results are pending.

The concentration of PCBs in PDMS is calculated in Table PCB-E2-4. Table PCB-E2-5 summarizes the concentration of the PCB PRCs in PDMS. As expected, the fridge blank had the highest concentrations of PRC PCBs among the blanks. However, the fridge blank did not have greater concentrations than all the field exposed samples. There was not great variability among the concentration of PCB PRCs in PDMS of the blanks (<15% CV); therefore, the average of the blanks was used to compare PDMS_{t=0} concentrations to PDMS_{t=final} concentrations to derive correction factors (CF). The concentration of PRC PCBs of the blank average was greater than field exposed samples except samples D113 and D114, indicating either the pump was not functioning or the pump did not increase the elimination rate of PRCs from the PDMS. Due to inclement weather and safety concerns, the pumps were not checked at the end of this sampling event to ensure each was functioning properly; therefore, it is not possible to determine which is the case. For PCB-69, sample D108 also had concentrations greater the average of the blanks. For PCB-104 and 154, 6 to 7 of the 10 samples did not have concentrations greater than the average of the blanks, indicating the penta- and hexachlorinated biphenyls were less affected by the pump than the tri- and tetrachlorinated biphenyls. The correction factors could not be calculated for samples D108, D113, and D114 since sufficient percent to steady state was not achieved for more than one PCB PRC. For the other 7 samples, an average of 38%, 15%, 6%, and 0.5% to steady state was reached for PCB-29, 69, 104 and 154, respectively (with CV ≤ 20%). This further supports the more chlorinated the biphenyl, the less affected the elimination rate of the PRC from the PDMS by pumping of water over the fiber. Also, it should be noted, the duration of deployment was approximately 6 hours. If the deployment time had been closer to the scoped goal of the 24 to 48 hours, each PCB PRC was likely to have reached at least 10% of steady state.

The sample specific CFs were calculated in Table PCB-E2-6, concentrations in water were calculated in Table PCB-E2-7, and summarized in Table PCB-E2-8. PCBs were not detected for samples D106, D109, D111, D112, and D115. Hexa- and heptachlorinated biphenyls were detected in samples D107 and D109 with total PCB concentrations of 0.16 and 0.22 ng/L, respectively. However, these detections were potentially spurious and due to analytical artifact, impurity in the PRC solution, or contamination in the process. Results checking for impurities in the PRC solution are pending.

The concentrations in the composite water samples were below the detection limit of 0.33 ng/L for all PCB congeners. The freely dissolved concentrations of total PCBs in water as measured by passive sampling are below this detection limit.

PAH and Pesticide Analysis

The partition coefficients and solubility of PAHs and pesticides are shown in Table PP-E2-1 (Smedes et al. 2009, US EPA 2012, Mayer et al. 2000, Achten and Andersson 2015, and ATSDR). Masses of the PAHs and pesticides in hexane extract are provided in Table PP-E2-2. PAH PRCs (acenaphthylene-d8, benzo(a)pyrene-d12, pyrene-d10) were detected above reporting limits in all samples and blanks, except for acenaphthylene-d8, which was not detected in sample D111. Acenaphthene, anthracene, benzo (a) anthracene, chrysene, fluoranthene, fluorene, phenanthrene, pyrene, alpha-chlordane, dieldrin, and gamma-Chlordane were detected in one or more samples above reporting limits (Table PP-E2-2). Concentrations in PDMS were calculated in Table PP-E2-3 and summarized for PAH PRCs in Table PP-E2-4. Although the concentrations of deuterated PAHs in the blanks were largely variable (CV 40% to 101%), the average was used to calculate the correction factors. Overall, the regression models for each sample had strong correlation ($r^2 > 0.8$), with the exception of samples D111 and D114, due to the high

concentration of pyrene-d10 in these samples compared to the other field exposed samples. Sample D113 had concentrations of pyrene-d10 greater than the average of the blanks. This may indicate the elimination rates of pyrene-d10 was not affected by the flow of water over the PDMS coating. Acenaphthylene-d8 and benzo(a)pyrene-d12 reached an average of 98% and 89% steady state, respectively, with little variability among the field exposed samples (standard deviation 1% to 7%, respectively). Though, pyrene-d10, reached an average of 77% to steady state with 47% standard deviations. However, it would be unexpected that pyrene-d10 would less readily eliminate from PDMS compared to benzo(a)pyrene based on partitioning coefficients. It may also indicate samples D111, D113, and D114 were either less affected by the pumped water or the pump was not functioning. The field crew was not able to note whether the pump was operational due to inclement weather and safety concerns. Correction factors were calculated in Table PP-E2-5 and concentrations in water were calculated in Table PP-E2-6. Acenaphthene was detected in two samples at concentrations of 17 and 35 ng/L. Anthracene was detected in five samples ranging from 4.4 to 21 ng/L. Benzo (a) anthracene was detected in two samples at 0.42 ng/L. Chrysene was detected in one sample at 0.43 ng/L. Fluoranthene was detected in five samples at 1.4 to 20 ng/L. Fluorene was detected in three samples at 10 to 20 ng/L. Phenanthrene was detected in seven samples at 4.8 to 58 ng/L. Pyrene was detected in six samples at 1.6 to 7.7 ng/L. alpha-Chlordane was detected in five samples at 0.043 to 0.089 ng/L. Dieldrin was detected in seven samples at 0.087 to 0.33 ng/L. Finally, gamma-Chlordane was detected in five samples at 0.042 to 0.06 ng/L.

In composite water for drifter samples, pesticides were not detected above 0.30 ng/L. The three pesticides detected by passive sampling had detected concentrations ranging from 0.043 to 0.33 ng/L. For 16 of 24 pesticide analytes, water composite sample collection had a higher detection limit compared to passive sampling measurements. One or more PAHs were detected in each composite water collection drifter sample. A comparison with the PAH analytes detected by passive sampling is shown in Table PP-E2-7.

For acenaphthene, anthracene, fluorene, and phenanthrene, the average concentration in water as measured by water composite sample collection and passive sampling were similar. For benzo (a) anthracene, fluoranthene, and pyrene concentrations were an order of magnitude higher via water composite collection, indicating the freely dissolved concentration is lower than total concentration. 1-methylnaphthalene, 2-methylnaphthalene, benzo (b) fluoranthene, benzo (g,h,i) perylene, chrysene, and naphthalene were detected by water composite sample collection (at concentrations below the reporting limit for all analytes and samples except sample D114 for naphthalene), and below the detection limit via passive sampling. Acenaphthylene, benzo (a) pyrene, benzo (k) fluoranthene, dibenz (a,h) anthracene, and indeno (1,2,3-cd) pyrene were not detected via either method.

Discussion and Conclusions

The preliminary laboratory results using a dye surrogate and PCB PRCs found the pumping system enhanced time to equilibrium and it was expected to be sufficient to obtain measurements with a deployment duration of one to two days.

For field deployment in Event 1 (approximately 12-hour exposure period), interpretation of passive sampling results was difficult due to uncertainty related to the condition of sample receipt by the analytical laboratory (use of pre-split caps leading to evaporation or leakage of hexane extract and not full submergence of fibers). Evaporation of hexane would likely lead to the concentration of analytes in

the remaining extract not necessarily lead to erroneous results. Furthermore, there was no sign of extract leakage as noted by the analytical laboratory; however, there is also not a method to determine if liquid leakage occurred and whether to the entire volume of PDMS was extracted prior to the release of extract from the vial. Given the results for PCBs do not show the PRCs reached sufficient equilibrium for quantitative estimation of freely dissolved concentrations, these results have been calculated for demonstration purposes only. The concentrations of PCBs were generally below detection limit as measured by passive sampling and composite water sample collection. For PAH PRCs, overall, the regression models had strong correlations. The PAH and pesticide detection limits were generally similar compared to composite water sample collection.

For field deployment in Event 2 (approximately 6 hour exposure period), hexane extracts were received in good condition by the analytical laboratory. Variability among the concentration of PCB PRCs in PDMS of the blanks was not large (<15% CV) and the concentration of PRC PCBs of the blank average was greater than field exposed samples except samples D113 and D114, indicating either the pump was not functioning for those samples or the pump did not increase the elimination rate of PRCs from the PDMS. Due to inclement weather and safety concerns, the pumps were not checked at the end of this sampling event to ensure each was properly functioning; therefore, it is not possible to determine which is the case. The correction factors could not be calculated for samples D108, D113, and D114 since sufficient percent to steady state was not achieved for more than one PCB PRC. For the other 7 samples, an average of 38%, 15%, 6%, and 0.5% to steady state was reached for PCB-29, 69, 104 and 154, respectively. This indicates the penta- and hexachlorinated biphenyls were less affected by the pump than the tri- and tetrachlorinated biphenyls. The influence of water velocity has been found to decrease with increasing the octanol–water partition coefficient in another PCB passive sampling study utilizing silicone rubber (Estoppey et al. 2014). Also, it should be noted, the duration of deployment was approximately 6 hours. If the deployment time had been closer to the scoped goal of the 24 to 48 hours, each PCB PRC may have reached at least 10% of steady state. The concentrations in the composite water samples were below the detection limit of 0.33 ng/L for all PCB congeners. The freely dissolved concentrations of total PCBs in water as measured by passive sampling are below this detection limit.

Regarding PAH PRCs, overall, the regression models for each sample had strong correlation ($r^2 > 0.8$), with the exception of samples D111 and D114, due to the high concentration of pyrene-d10 in these samples compared to the other field exposed samples. Also, sample D113 had concentrations of pyrene-d10 greater than the average of the blanks. This may indicate the elimination rates of pyrene-d10 was not affected by the flow of water over the PDMS coating. Acenaphthylene-d8, benzo(a)pyrene-d12, and pyrene-d10 reached an average of 98%, 89%, and 77% of steady state, respectively. However, it would be unexpected that pyrene-d10 would less readily eliminate from PDMS compared to benzo(a)pyrene based on partitioning coefficients. This may indicate samples D111, D113, and D114 were either less affected by the pumped water or the pump was not functioning. Sensitivity of the passive sampling device was generally comparable or lower than observed via water composite sample collection and compared to other studies (Vrana et al. 2006).

The elimination rates for PCB-29, 69, 104, and 154 were an average of 2.0, 0.74, 0.31, and 0.10 d⁻¹, respectively (time to 95% equilibrium of 1.5, 4, 10, and 31 days, respectively). The elimination rates for acenaphthylene-d8, benzo(a)pyrene-d12, and pyrene-d10 were an average of 0.18, 0.30, and 0.24 d⁻¹, respectively (time to 95% equilibrium of 4, 7, and 6 hours, respectively).

In conclusion, further research is needed to support the application of flow to achieve shorter term passive sampling for measurement of freely dissolved concentration of hydrophobic organic contaminants in water. Identification of the limitations of the application of flow, such as identifying analytes of interest for which this is most applicable, and the optimization of flow rates would be of interest. Short term passive sampling of water would help in avoidance of potential biofouling issues, minimize sampler loss and vandalism, and limit the duration of the time integrated sample, as desired, to capture the exposure of interest (such as a stormwater plume).

EXECUTIVE SUMMARY

Chronic toxicity testing with purple sea urchin (*Strongylocentrotus purpuratus*) embryos was performed using standardized protocols (USEPA 1995) to evaluate the environmental quality of receiving water at Naval Base San Diego near Paleta creek adjacent to Naval Base San Diego during and immediately following a storm event. The results reported are from two rain events: January 5th and January 31st, 2016. A total of seven and 10 samples were tested for the January 5th and January 31st, 2016 storms, respectively.

Storm water samples were collected using the Drifter Exposure System (DrEx), which is designed to collect surface waters while drifting with currents within the resulting storm water plumes. For the January 5th storm, samples from Drifter #106 and 107 resulted in toxic responses at the highest testable concentration using student's t-test when compared to laboratory controls. The Test for Significant Toxicity (TST) provided similar results and also found the sample from Drifter #114 to be significantly lower from its respective controls. For the January 31st storm, samples from Drifters #106, 107, 108, 109, 110, 111, 112 resulted in significant reduction in embryological development relative to the controls at the highest testable concentration using student's t-test. The TST resulted in only five of the same six samples being toxic (#106, 107, 108, 109, and 112). It is important to note that the drifter ID is independent between the two storms and does not indicate similarities in trajectories taken during deployment. Drifter IDs showing similar toxicity between the two storms is merely coincidence. In addition, it should be noted that toxic results ranged from 0 to 89% normal larval development, therefore, we recommend that relative toxicity be investigated depending on goals and comparisons with other parameters associated with the Drifter project.

INTRODUCTION

Chronic toxicity testing using the purple sea urchin (*Strongylocentrotus purpuratus*) embryo-larval development test (USEPA 1995) was performed to evaluate the environmental quality of water samples collected from up to 10 Drifters that were deployed for a duration of up to 12 hours. Samples were collected from an oceanographic-styled Global Positioning System (GPS) drifting buoy that is designed to move with the water currents (DrEx). Drifters were deployed at the onset of each storm event and allowed to drift within the resulting storm water plume that entered into the receiving embayment downstream from Paleta Creek. The DrEx system is designed to collect up to five liters of surface water at a rate of approximately 0.5ml/sec into a sampling bag.

Two storms were targeted for deployment of 10 DrEx systems. The first storm occurred on January 5th and DrEx systems were deployed for a total of 12 hours; the second storm occurred on January 31st and DrEx systems were deployed for a total of 6 hours. The second storm resulted in a shorter sampling duration due to adverse weather conditions at the sampling location which resulted in the DrEx systems being retrieved earlier than planned.

Seven samples were obtained from the January 5th storm and 10 samples were collected from the January 31st storm. Toxicity testing on collected samples for the first and second storms was conducted at the SPAWAR

Systems Center – Pacific Bioassay Laboratory on January 7th through January 11th, 2016 and February 1st through February 5th, 2016, respectively.

MATERIALS AND METHODS

Test Material

Test material consisted of seven or 10 composite water samples collected by automated samplers on the DrEx systems for the first and second storm, respectively. Samples were collected in 5-L PTFE gas sampling bags within the DrEx system. Following the sampling period, sample bags were removed from each DrEx system and transferred to the laboratories at SPAWAR Systems Center (SSC) by SSC staff. Additionally, at the onset of each storm, an ambient grab sample was collected from the approximate location from where the Drifters were initially deployed. Samples were split by SSC staff and a subsample was provided to the SSC Bioassay Laboratory for toxicity testing in 250ml HPDE bottles. Sample collection and receipt times for each storm event are summarized in

Table 1 and Table 2. Copies of chain of custody forms are provided in Appendix D. Upon receipt in the SSC Bioassay Laboratory, water quality parameters including pH, dissolved oxygen (DO), salinity and temperature were measured prior to testing.

Chronic Toxicity Test Methods

Testing was conducted in accordance with standard methods (USEPA 1995). The purple sea urchin embryo-larval development test was conducted on all samples listed in

Table 1 and Table 2. For all samples, two concentrations were tested; 10%, and the highest concentration attainable following addition of hypersaline brine to adjust for salinity (range 73-84% of initial sample). Two laboratory controls were tested concurrently and consisted of filtered natural seawater from north San Diego Bay (SSC Pacific SD Bay seawater) and a hypersaline brine control, previously derived from SD Bay seawater. A summary of the tests conditions is provided in Table 3.

Table 3. Purple Sea Urchin Embryo-Larval Development Toxicity Test Specifications

| | |
|--|---|
| Test periods | 1/7/2016-1/11/2016; 2/1/2016-2/5/2016 |
| Test endpoint | Embryo-Larval Development Success (Proportion Normal) |
| Test organism | <i>Strongylocentrotus purpuratus</i> (Purple Sea urchin) |
| Test organism source | Field Collected in San Diego |
| Test solution renewal | None |
| Feeding | None |
| Test chamber | 30-mL scintillation vial |
| Test solution volume | 10 mL |
| Test temperature | 15 ± 1°C |
| Control/ Dilution water | Natural seawater (Source: Scripps Institution of Oceanography intake) |
| Additional control | Hypersaline brine |
| Sample manipulation | Hypersaline brine was used to increase the salinity of all samples to 34 ± 2 ppt |
| Test concentrations (% of sample) | 72+ and 10 percent, plus lab and brine controls |
| Number of organisms/chamber | 250 embryos (from acceptable eggs and appropriate sperm density to provide > 90% fertilization success (determined in a pre-test trial) |
| Number of replicates | 4 |
| Photoperiod | 16 hours light/8 hours dark |
| Test Protocol | EPA 600/R-95/136, 1995 West Coast Manual (USEPA 1995) |
| Test acceptability criteria for controls | ≥ 80% normal development, < 25 % Minimum Significant Difference (MSD) |
| Reference toxicant | Copper sulfate: 0, 5.8, 8.4, 12, 17.2, 24, & 35 µg/L CuSO ₄ |

RESULTS

Water quality parameters upon sample receipt at SSC Pacific are summarized in Table 4 and Table 5 and Appendix C.

Table 4. Water Quality Parameters Measured Upon Receipt – January 5th, 2016

| Drifter ID | Laboratory Sample ID | Temp (°C) | Dissolved Oxygen (mg/L) | pH (units) | Salinity (ppt) |
|------------|----------------------|-----------|-------------------------|------------|----------------|
| - | Ambient Sample | 10.4 | 7.0 | 7.52 | 3.32 |

| 115 | D10 | 11.8 | 8.2 | 7.75 | 27.1 |

Table 6 and Table 7 summarize the results from the sea urchin embryo-larval development test for the January 5th and January 31st exposures, respectively. Both rounds of testing had controls that met the minimum test acceptability criteria of 80 percent normal development. All water quality parameters measured were within the recommended range for the duration of the test. Complete statistical summaries and bench water quality sheets are provided in Appendix A.

Table 6. Results Summary for Sea Urchin Embryo-Larval Development – January 5th, 2016

| Test Concentration (%) | Sea Urchin Mean 96-hr Development (% normal) | | | | | | | |
|------------------------|---|-------------------------|------------------------|-------------|-------------|-------------|-------------|-------------|
| | Ambient Sample | Drifter 106 | Drifter 107 | Drifter 108 | Drifter 110 | Drifter 111 | Drifter 112 | Drifter 114 |
| Lab Control | 86.3 | 86.3 | 86.3 | 86.3 | 86.3 | 86.3 | 86.3 | 86.3 |

| TST Results | Not Toxic | Toxic | Toxic | Toxic | Toxic | Not Toxic | Not Toxic | Toxic | Not Toxic | Not Toxic | Not Toxic |

Values in **bold** indicate a statistically significant decrease compared to the brine control as determined with the student's one tailed t-test.
Level of statistical significance: a - <0.05, b - <0.01, c - ≤0.001.

*Indicates the highest concentration possible to test was <100% effluent, due to the addition of hypersaline brine; Actual values tested are as follows: Ambient (83.1%), 106 (84.0%), 107 (78.2%), 108 (78.6%), 109 (74.8%), 110 (82.6%), 111 (76.3%), 112 (84.10%), 113 (84.3%), 114 (77.2%), 115 (87.0%)

All samples were statistically evaluated against the brine control for each respective testing date as hypersaline brine was added to all samples to increase the salinity to 34 ± 2 ppt. Two statistical analyses were performed: 1) a one-tailed student's t-test assuming unequal variances, and 2) a Test for Significant Toxicity (TST). The TST statistical method only evaluates the highest concentration tested (critical concentration) against the brine control. TST methods examine whether the results of a given sample relative to its respective control differs by an a priori prescribed amount rather than whether they are the same, as in traditional hypothesis testing. For the sea urchin test, the a priori critical percent difference is set at 25%.

For the January 5th storm event, the composite sample from Drifter #106 showed a significant decrease from the brine control at both the 10% and the 84.8% concentrations (Table 6). The sample from Drifter #107 showed a significant decrease from the brine control at the highest concentration tested, 86.8% (Table 6). The ambient sample collected at the onset of the storm also showed a significant decrease from the brine control at the highest concentration tested, 49.1% (Table 6). All other samples during the January 5th storm showed no observable decreases from the brine control. Statistical analyses using the TST method found adverse effects of the samples from Drifter #106 and #107, as well as the sample from Drifter #114. No toxicity was observed in the remainder of the Drifter samples using the TST methodology.

For the January 31st storm event, using the students t-test, significant decreases from the brine control were observed for Drifters #106, 107, 108, 109, 110, 111 and 112 (Table 7). Drifter samples #113, 114 and 115 showed no observable adverse effects compared to the brine control. Statistical analyses using the TST found adverse effects relative to the brine control in Drifter samples #106, 107, 108, 109, and 112 (Table 7). No toxicity was observed in the remainder of the samples using the TST methodology. Interestingly, Drifter samples #110 and 111 found to be significantly decreased from the brine control using the student's t-test method were classified as Non-Toxic using the TST methodology. This is due to the *a priori* assigned percent difference from the control that will classify a sample as being toxic or not. In the case of samples #110 and 111, the differences from the brine control were 7.30 and 8.82 percent, respectively. The ambient sample collected at the onset of the storm did not show a significant decrease from the brine control at the highest concentration tested, 83.1% (Table 7).

QA/QC

Minor QA/QC deviations from EPA and internal protocols from tests were noted on raw data sheets. A thorough review of the data and test procedures did not identify any likely impacts on test results as a result of these deviations; therefore, all presented data were qualified as acceptable. Additionally, all test acceptability criteria were met, unless noted below. Reference toxicant test results are summarized in Table 8 and are available in full in Appendix B.

For the January 5th storm event, testing was initiated within 38 hours of sample collection, outside the EPA recommended 36 hour holding time, but stormwater testing within 48 hours of collection is generally considered

acceptable, considering transfer and logistical constraints. Additionally, temperatures of the samples were outside the EPA recommended range of 0-6°C upon receipt at the SSC Pacific Bioassay Laboratory. The deviations occurred primarily due to timing of sample delivery. The samples were being split for analytical and toxicological measurements and subsequently warmed up to a minor degree during the process and delayed the time of arrival to the Bioassay Laboratory.

For the January 31st storm event, testing was initiated within the EPA recommended 36 hour holding time. Temperatures of the samples upon receipt were outside the EPA recommended range of 0-6°C upon receipt at the SSC Pacific Bioassay Laboratory. However, the samples were in a state of cooling and the deviation was deemed acceptable and testing was conducted as planned.

Control test acceptability criteria were met for the sea urchin larval development tests (USEPA 1995; Table 2). Some minor deviations from test protocols were observed such as high salinity measurements (> 36 ppt) observed in water quality surrogate cups. However, a surrogate salinity vial (of the same size as the test vials) confirmed that salinities were within range of test (34 ± 2 ppt). Thus, these deviations did not have an impact on test validity. A glossary of the qualifier codes used on the test datasheets is provided in Appendix E.

REFERENCE TOXICANT TESTING

Concurrent reference toxicant tests with copper sulfate were conducted during each round of testing to assess the health of the test organisms and technical quality assurance. Reference toxicant test results are summarized in Table 8 below and are available in full in Appendix B. The laboratory control associated with the reference toxicant test were slightly below test acceptability criteria of 80% normal development (76.8% normal development) during the first (1/6/2016) tests. However, all other laboratory controls for the same first round of testing met test acceptability criteria. Given this and that the dose response was appropriate, this reference toxicant test was deemed acceptable.

During the second round, the laboratory control associated with this test met test acceptability criteria. In both tests, the median effective concentration (EC₅₀) value was within two standard deviations of the internal historical mean (18.6 ± 9.5µg/L); indicating sensitivity to copper was consistent with that historically observed for this organism.

Table 8. Reference Toxicant Test Results

| Species & Endpoint | Test Date | NOEC (µg/L copper) | LC ₅₀ or EC ₅₀ (µg/L copper) |
|--------------------------------------|-----------|-----------------------|---|
| Sea Urchin Embryo-Larval Development | 1/6/2016 | 17.2 | 22.9 |
| Sea Urchin Embryo-Larval Development | 1/31/2016 | 12 | 19.58 |

SUMMARY

Samples were collected from DrEx systems during two storm events on January 5th and January 31st, 2016. During the January 5th storm, two samples (#106 and 107) resulted in significant decreases in proportion normally developed embryos at the highest testable concentration using one sided student's t-tests. Similar results were found using TST methods, although an additional sample (#114) suggested toxicity. For the January 31st storm, seven samples (#106, 107, 108, 109, 110, 111, and 112) showed significant decreases in proportion of normally developed embryos at the highest testable concentration using one sided student's t-tests. The TST demonstrated only five samples being toxic (#106, 107, 108, 109, and 112).

Embryo-Larval Development Test – SPAWNING CHECKLIST & CALCULATIONS

Batch ID: P209155p
 Analyst: GR

Spawn/Test Date: 1/7/2016
 Test Species: S. purpuratus

| Task | Time |
|--------------------------------------|--|
| Spawning Inducement Initiated | 1300 HR. |
| Spawning Begins | 1310 HR |
| Females/Males Isolated in Incubator | 1326 HR 30 ⁺ combined 39 sep. |
| Fertilization Initiated | 1326 HR. |
| Fertilization Terminated/eggs rinsed | 1336 HR |
| Embryo Counts | 1430 HR |
| Embryo addition to vials | 1545 |

Embryo Counts:

Embryo Stock #1: 42, 41, 38 Mean = $\frac{40.3}{3}$ uL * 1000 uL/mL = 2017 cells/mL
 Embryo Stock #2: 47, 45, 42 Mean = $\frac{45}{3}$ uL * 1000 uL/mL = 2233 cells/mL
 Embryo Stock #3: 49, 42, 56 Mean = $\frac{49}{3}$ uL * 1000 uL/mL = 2450 cells/mL

Adjust selected embryo stock to 2000 embryos/ml. Confirm density:

Selected Stock : _____ Mean = _____ uL * 1000 uL/mL = _____ cells/mL

Add 100 µl of 2000 embryo/ml stock to obtain 20 embryos/ml in test vials.

Notes:

Add 100 µl of any of the 3 stocks. #1 looks best at 1430 HR.

Stock #1 used for inoculating.
 100% division @ 2 cell stage.

Embryo-Larval Development Test – SPAWNING CHECKLIST & CALCULATIONS

Batch ID: 012816SP
 Analyst: JMD

Spawn/Test Date: 2/2/2016
 Test Species: S. purpuratus

| Task | Time |
|--------------------------------------|-------|
| Spawning Inducement Initiated | 12:30 |
| Spawning Begins | 12:40 |
| Females/Males Isolated in Incubator | 1305 |
| Fertilization Initiated | 1310 |
| Fertilization Terminated/eggs rinsed | 1330 |
| Embryo Counts | 1420 |
| Embryo addition to vials | 1520 |

Embryo Counts:

Embryo Stock #1: 42, 22, 31 Mean = 31 / 20 uL * 1000 uL/mL = 1583 cells/mL

Embryo Stock #2: 31, 25, 26 Mean = 28 / 20 uL * 1000 uL/mL = 1400 cells/mL

Embryo Stock #3: _____, _____, _____ Mean = _____ / _____ uL * 1000 uL/mL = _____ cells/mL

Adjust selected embryo stock to 2000 embryos/ml. Confirm density:

Selected Stock : _____, _____, _____ Mean = _____ / _____ uL * 1000 uL/mL = _____ cells/mL

Add 100 µl of 2000 embryo/ml stock to obtain 20 embryos/ml in test vials.

Notes:

Add 150ul of Stock #1 for final density of ~237 cell/vial.
Selected Stock #1

CuSO₄ Reference Toxicant Concentration Calculations

Jan-16

Cu Stock Date 9 Mar 2011 (A)
QC: MC

SUBSTOCK CALCULATIONS

Stock 1 g/L
substock 1 mg/L 1000 µg/L

1PPM 1000 µg/L: 0.1 mL of 1 g/L stock into 100 mL SIO ✓

Echino: 1ppm

Volume / concentration needed= 200 mL

$C1V1 = C2V2$

$C1 = 200$ 1000 $V2$
 $V2 = C1 * 200 / 1000$

Conc's (µg/L): Volume (mL) of 1000 µg/L stock into 200 mL FSW:

| | | |
|------|------|---|
| 5.8 | 1.16 | ✓ |
| 8.4 | 1.68 | ✓ |
| 12 | 2.40 | ✓ |
| 17.2 | 3.44 | ✓ |
| 24 | 4.80 | ✓ |
| 35 | 7.00 | ✓ |

20.48 mL of stock needed

Embryo Larval Bioassay

96-Hour Development

Project: SEBDP / Drifter Storm #1

Test Species: S. purpuratus

Sample ID: Copper Ref. tox

Start Date: 1/17/16

Test No.: SSC-2016-001

End Date: 1/11/16

Embryo-Larval Development Test – SPAWNING CHECKLIST & CALCULATIONS

Batch ID: P209155p
 Analyst: GR

Spawn/Test Date: 1/7/2016
 Test Species: S. purpuratus

| Task | Time |
|--------------------------------------|--|
| Spawning Inducement Initiated | 1300 HR. |
| Spawning Begins | 1310 HR |
| Females/Males Isolated in Incubator | 1326 HR 30 ⁺ combined 39 sep. |
| Fertilization Initiated | 1326 HR. |
| Fertilization Terminated/eggs rinsed | 1336 HR |
| Embryo Counts | 1430 HR |
| Embryo addition to vials | 1545 |

Embryo Counts:
 Embryo Stock #1: 42, 41, 38 Mean = 40.3 / 20 uL * 1000 uL/mL = 2017 cells/mL
 Embryo Stock #2: 47, 45, 42 Mean = 45 / 20 uL * 1000 uL/mL = 2233 cells/mL
 Embryo Stock #3: 49, 42, 56 Mean = 49 / 20 uL * 1000 uL/mL = 2450 cells/mL

Adjust selected embryo stock to 2000 embryos/ml. Confirm density:

Selected Stock : _____ Mean = _____ / _____ uL * 1000 uL/mL = _____ cells/mL

Add 100 µl of 2000 embryo/ml stock to obtain 20 embryos/ml in test vials.

Notes:

Add 100 µl of any of the 3 stocks. #1 looks best at 1430 HR.

Stock #1 used for inoculating.
100% division @ 2 cell stage.

January 31st, 2016

Embryo-Larval Development Test – SPAWNING CHECKLIST & CALCULATIONS

Batch ID: 012816SP
 Analyst: JMD

Spawn/Test Date: 2/2/2016
 Test Species: S. purpuratus

| Task | Time |
|--------------------------------------|-------|
| Spawning Inducement Initiated | 12:30 |
| Spawning Begins | 12:40 |
| Females/Males Isolated in Incubator | 1305 |
| Fertilization Initiated | 1310 |
| Fertilization Terminated/eggs rinsed | 1330 |
| Embryo Counts | 1420 |
| Embryo addition to vials | 1520 |

Embryo Counts:

Embryo Stock #1: 42, 22, 31 Mean = 31 / 20 uL * 1000 uL/mL = 1583 cells/mL

Embryo Stock #2: 31, 25, 26 Mean = 28 / 20 uL * 1000 uL/mL = 1400 cells/mL

Embryo Stock #3: _____, _____, _____ Mean = _____ / _____ uL * 1000 uL/mL = _____ cells/mL

Adjust selected embryo stock to 2000 embryos/ml. Confirm density:

Selected Stock : _____, _____, _____ Mean = _____ / _____ uL * 1000 uL/mL = _____ cells/mL

Add 100 µl of 2000 embryo/ml stock to obtain 20 embryos/ml in test vials.

Notes:

Add 150ul of Stock #1 for final density of ~237 cell/vial.
Selected Stock #1

Appendix E
Glossary of Qualifier Codes

Glossary of Qualifier Codes:

- Q1 – pH out of recommended range; refer to CAR
- Q2 – Temperatures out of recommended range; corrective action taken and recorded in Test Temperature Correction Log
- Q3 – Temperatures out of recommended range; no action taken, test terminated same day
- Q4 – Sample aerated prior to initiation or renewal
- Q5 – Salinity out of recommended range; refer to QA section of report
- Q6 – Spilled test chamber/ Lost test animal
- Q7 – Instrumentation Error/Failure; refer to CAR
- Q8 – Inadequate sample volume, 50% renewal performed
- Q9 – Inadequate sample volume, no renewal performed
- Q10 – Sample out of holding time; refer to QA section of report
- Q11 – Refer to QA section of report for explanation
- Q12 – Supplemental information is footnoted
- Q13 – Test initiated with an incorrect number of test organisms
- Q14 – Replicate(s) not initiated
- Q15 – Survival counts not recorded due to poor visibility or heavy debris
- Q16 – Test aerated due to dissolved oxygen levels dropping below 4.0 mg/L
- Q17 – Test initiated with aeration due to an anticipated drop in dissolved oxygen
- Q18 – Airline obstructed or fell out of replicate and replaced, drop in dissolved oxygen occurred
- Q19 – Animals out of appropriate age range at test initiation
- Q20 – Readings not taken, tech error
- Q21 – Organisms in replicate not counted, tech error
- Q22 – Dissolved oxygen above recommended range, but remained within the 100% $\pm 10\%$ saturation requirement

Appendix B7: GPS Validation Data
